# Otomat: OAuth 2.0 flow, scopes and revocation

Otomat is a private command-line tool with exactly one user: the channel owner. There is no sign-up, no web or mobile interface and no other accounts.

Authorization: the owner runs the tool once on their own computer. It opens Google's standard OAuth consent screen (OAuth client type: Desktop app; installed-app flow with offline access). The owner signs in, selects the brand account of the channel Earth in Numbers and approves. The refresh token is stored as an encrypted GitHub Actions secret in the owner's private repository and is used only to act on that channel.

Scopes requested and why:

```
youtube.upload              upload one video per day to the owner's channel

youtube.force-ssl           add caption tracks and localized titles/descriptions

yt-analytics.readonly       read the channel's own analytics to choose future topics
```

Revocation: the owner can revoke access at any time at https://myaccount.google.com/connections (Third-party apps & services → Otomat → Delete all connections). The privacy policy explains this and the deletion of stored data: https://scryne.github.io/otomat-site/privacy.html

# Otomat: upload (automated, no user interface)

There is no upload screen. A scheduled GitHub Actions job runs once a day: it reads open data (USGS, World Bank, Eurostat), computes the facts in code, renders a 9:16 map/chart animation with synthetic narration and captions, checks the text with fact-check gates, then calls videos.insert once.

Example of the request body sent for one generated video:

```
title:        Europe's Lowest Real GDP per Person Countries

categoryId:   28 (Science & Technology)

privacyStatus: private, publishAt: next day 14:00 UTC

defaultLanguage / defaultAudioLanguage: en

localizations: es, pt, de, fr (title + description)

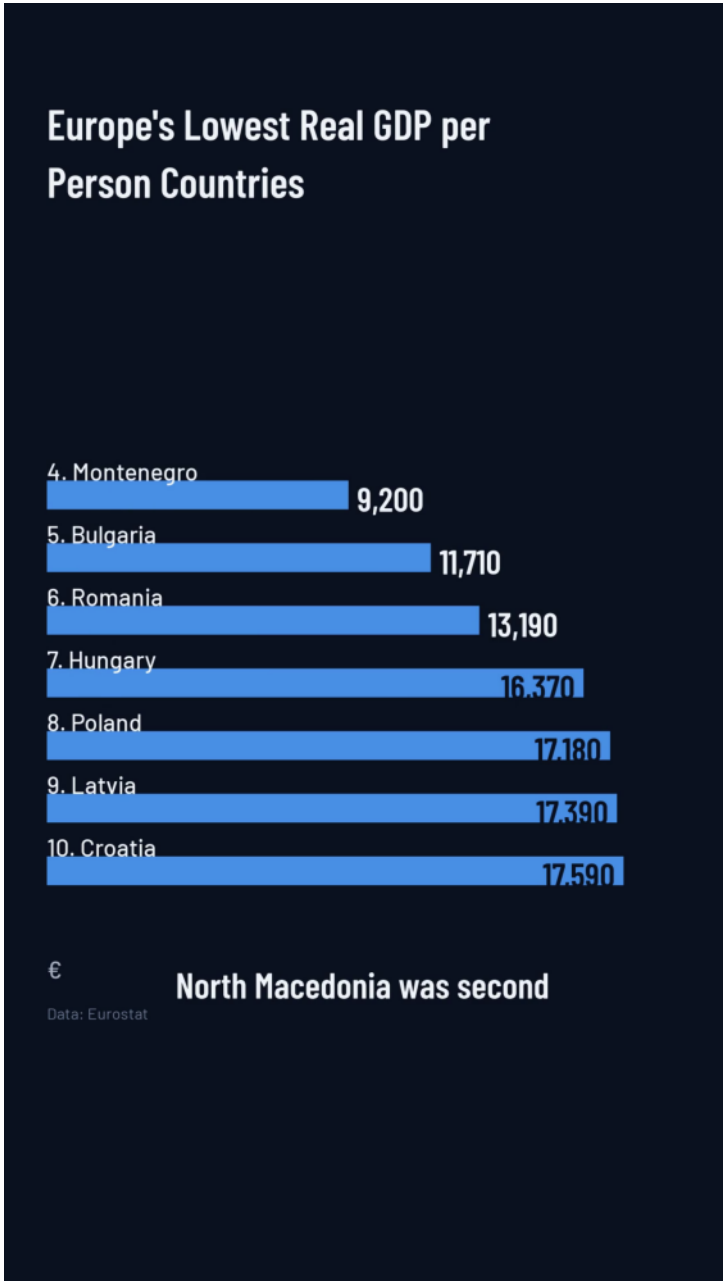

tags:         ranking, Europe
```

Then captions.insert is called once per language (en, es, pt, de, fr). Description excerpt:

```
Which European nation has the lowest real GDP per person?
```

Every video credits its data source and license on screen and in the description.

Frame of a generated video (1080×1920)

# Otomat: analytics and reporting (internal only)

Otomat reads the YouTube Analytics API for the owner's own channel only: views, engagedViews and averageViewPercentage per video (dimension: video; filter: creatorContentType==SHORTS).

Purpose: decide which topics and opening styles to make next. The numbers are stored in aggregated form in the owner's private repository and summarized in an internal weekly text report read only by the owner. No analytics data is displayed publicly, shared, or combined with data about other channels.

No data about viewers is collected. No other channel is accessed.
